

PIONEERS MEMORIAL HOSPITAL

Brawley, CA

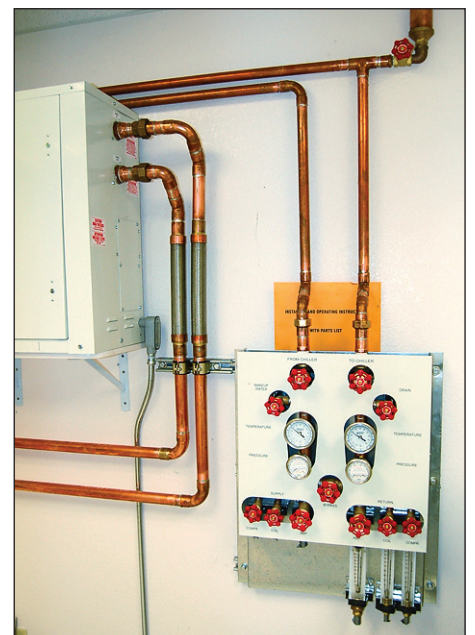

Client Project

Pioneers Memorial Hospital needed to expedite the construction of their MR facility without disrupting patient flow and functionality. This would allow them to fully integrate their imaging department and maintain competitiveness, while enhancing patient services, and increasing revenues.

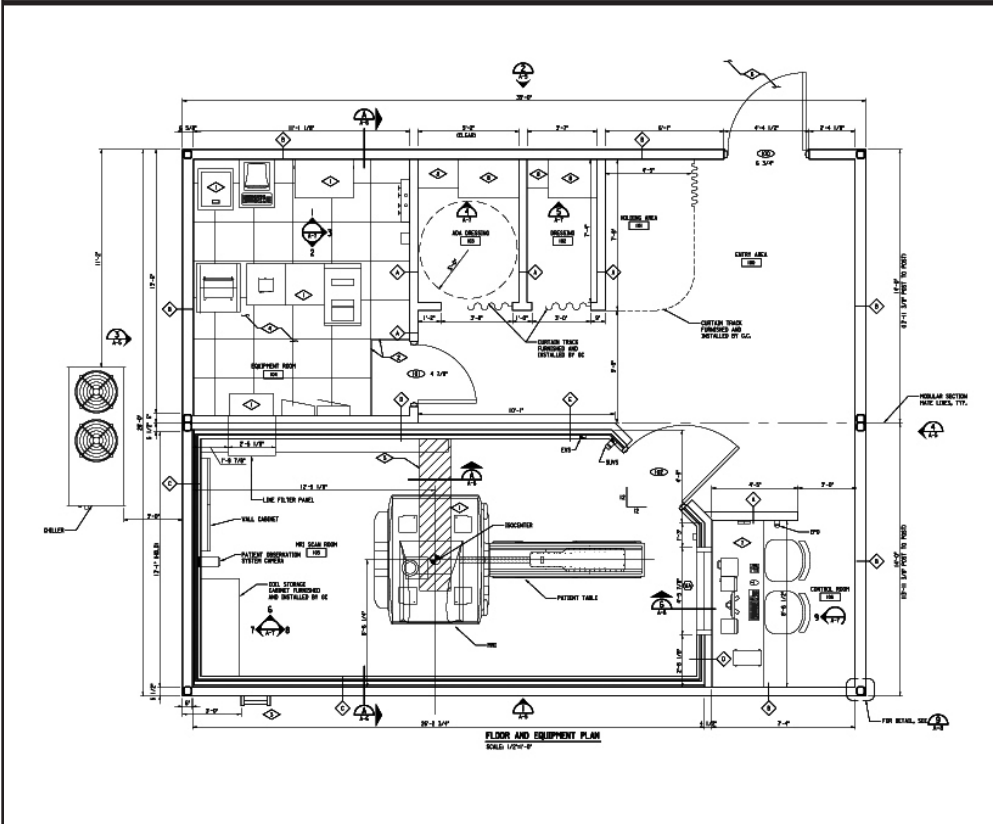

Client Need

In considering whether to build a permanent addition to their Radiology department or enable a longer-range master plan of new hospital construction, Pioneers chose the modular imaging enclosure because the building is completely relocatable and could potentially be moved without de-installing the magnet. This would save thousands in lost revenue and optimize operating expenses.

PIONEERS MEMORIAL HOSPITAL

Brawley, CA

The Williams Scotsman Solution

The modular imaging enclosure consists of two 14' x 35' modules that were constructed off-site in a factory controlled environment. The diagnostic imaging facility was outfitted with RF shielding in the factory prior to shipping, in order to increase quality and limit the amount of finishing necessary on site. Upon delivery, the modules were crane set on to a concrete perimeter foundation in an area between two existing buildings. The stucco exterior was created with recessed lateral and horizontal striping, meant to mimic the existing hospital campus' architectural design. In addition, a custom steel canopy was constructed to connect the new modules to the adjacent building. The canopy was built to mirror the outline of an adjacent building and seamlessly transition between the new and existing structures.

The Result

Williams Scotsman working in conjunction with its manufacturing partner, the OEM, and the hospital constructed and installed the MR facility within 120 days. The 28' x 35' finished space includes a procedure room, control room, waiting area, dressing rooms and an equipment room outfitted with a Toshiba 1.5T magnet.
